Chymosin can be produced in a plant seed through introduction of a chimeric nucleic acid molecule, comprising a nucleic acid sequence encoding a chymosin polypeptide operatively linked to transcription regulator and terminator sequences, into a plant cell. The sequences are useful for producing plant seeds, in particular seeds of soybean, rape seed, sunflower, cotton, corn, tobacco, alfalfa, wheat, barley, oats, sorghum, Arabidopsis thaliana, potato, flax/linseed, safflower, oil palm, groundnut, Brazil nut, coconut, castor, corlander, squash, jojoba and rice.
